       Fibrinogen-binding protein from coagulase-negative Staphylococcus - used
       for prevention, treatment and diagnosis of Staphylococcus infection.
       Example 3; Fig 6; 45pp; English.
       The protein comprises the fibrinogen binding protein (FIG) of coagulase-
       negative Staphylococcus epidermidis HB. Its amino acid sequence was
       deduced from the isolated fig gene (see AAV04279). The closest known
       analogue of FIG is the clumping factor of S. aureus which also binds fibrinogen and promotes bacterial aggregation in serum Recombinant FIG polyapetides can be expressed in host cells. They are used as immunogens,
       portycellores and cashed in may be expressed in vivo) to protect humans and animals against coagulase-negative Staphylococcus infection. Antibodies raised against FIG can be used for passive immunisation. The
       block the adherence of bacteria) and for diagnosis. (Updated on 17-CCT-2003 to standardise CS field)
       Revised record issued on 18-CCT-2007: Enhanced with precomputed
       information from BOND.
